Abstract

The aim of this study is to demonstrate the practical value of radioscopic differentiation materials. The proposed method for achieving singling out and identifying four basic groups of materials according to an atomic number is complex. Atomic numbers are identified using high- and low-energy profiles obtained through the irradiation of materials. The experiment is done using gamma-ray beams with 1.25 MeV/0.662 MeV dual energies and by using NaI(Tl) scintillation detector. In addition to simulation under the same condition for the experiment, the MCNP simulation is done using bremsstrahlung X-rays from 9 MeV/4 MeV dual electron beam.
**Discrimination Method**

- \( t \): thickness of material [cm]
- \( \mu \): total linear attenuation coefficient [cm\(^{-1}\)]
  \[ \mu = \tau + \sigma + \kappa \]
  - \( \tau \): contribution of photoelectric effect
  - \( \sigma \): contribution of Compton effect
  - \( \kappa \): contribution of pair production
- Total Attenuation = \( f (Z_m, \rho_m, t_m, E_{\gamma-ray}) \)

\[
l = I_0 e^{-\mu t}
\]

\[
\mu t = \ln \left( \frac{I_0}{I} \right)
\]

**Discrimination is not possible!**

\[
\frac{\mu}{\mu'} = \frac{\ln \left( \frac{I_0}{I} \right)}{\ln \left( \frac{I_0'}{I'} \right)} = R (E_1, E_2, t, Z)
\]
**Experimental Setup**

### Gamma-ray Source

Conclusion

- The aim of this research is to demonstrate the practical value of radioscopic differentiation materials.
- We have measured with the Dual Energy (Cs-137 : 0.662 MeV, Co-60 : 1.173, 1.332 MeV) to estimate the ratio of attenuation coefficients for the materials.
- The measured data in this study are in good agreement with the MCNP simulation.
- We have extended the energy level to 9 MeV / 4 MeV Bremsstrahlung in order to discover the optimal energy for Dual Energy Method.
- The Dual Energy Method with 9 MeV / 4 MeV is more effective for the discrimination of materials according to their atomic number compared to the Single Energy Method.
- Back Scattering Method is especially effective for the discrimination of low Z material.
- It is more effective for the discrimination of materials to combine the Dual Energy Method and Back Scattering Method.
